Particle Counting 101

What are airborne particle counters used for?

Airborne particle counters monitor particles and contamination in large, critical spaces like pharmaceutical/industrial cleanrooms and healthcare facilities. They can also be used in public spaces of commercial buildings or in construction areas to ensure clean air free of contaminants.

How small are the particles that Setra's devices can measure?

Particles are measured in micrometers (0.001 mm), also known as **microns (µm)**. The naked eye can see objects as small as 50 µm, or roughly the thickness of a human hair.

Typical organic particles (e.g. bacteria, mold spores, etc.) range in sizes between 0.5 µm and 10 µm. Setra's particle counters and air quality monitors can measure particles between 0.3 µm and 25 µm in diameter.

Why do hospitals and pharmacies need to measure particles?

- Mandated by FDA/ISO regulations in compounding cleanrooms
- Ensures products being manufactured are free from environmental contaminants
- Demonstrates cleanliness of operating rooms and other critical environments
- Monitors indoor air quality in/around areas under construction
